IDAHO

JANUARY 1951

Volume LIV No. 1

SAN FRANCISCO: 1951

IDAHO - JANUARY 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

This was a rather typical January in Idaho, in contrast to last year when the weather was unusually cold in the north, and to January 1949 when there were record-breaking statewide low temperatures.

This year, average temperatures were very close to the January means in all divisions of the State, although for individual stations the departures ranged from -4.9° to +4.7°. Precipitation averages showed moderate positive departures from the mean in the northern and southwestern divisions and moderate deficiency in the southeast; at individual stations departures ranged from -1.01 inches at American Falls to +2.51 inches at Pierce Ranger Station. Snowfall averaged above the January mean for the State, but was only 62% of the record-breaking average of January 1950. Percent of possible sunshine, based on reports from the few stations that record such data, was below the January mean and wind movement was greater than usual.

Weather conditions were mostly favorable for stock and the agricultural outlook, although some grain land remained bare with alternate periods of thawing and freezing. Mountain snow depths were generally above normal in all sections at the close of the month. The cold wave during the closing days was believed to have had little effect on fruit trees, but probably did some damage to fall-sown grains. No losses of livestock were reported. There was heavy feeding, but hay was plentiful and livestock remained in good condition in all sections.

Day to day weather was rather uneventful during most of the month with mild conditions prevailing most of the time. A particularly warm spell occurred in mid-month, accompanied by widespread and rather generous amounts of precipitation. High winds were reported on a number of days in all sections of the State, but the windstorm of the 15th in northern Idaho was the only one classed as destructive. At Coeur d'Alene this windstorm resulted in one fatality when a man was struck by a falling tree. Reported damage from this storm included the breaking of telephone and power lines and the uprooting of trees, with some blocking of roads, in Shoshone County. Earlier in the month, on the 3d, Shoshone County also sustained considerable damage to power lines when freezing precipitation overloaded the wires.

One of the outstanding events of the month was the cold wave that moved southward across the State, entering northern counties on the evening of the 26th and covering all sections by early morning of the 28th. Subzero temperature readings were reported from nearly all parts of the State during the last four days of the month, with only the warmer, low-elevation localities remaining a few degrees above the zero mark.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief,U.S. Weather Bureau,Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index,but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches,and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5,is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

FEBRUARY 1951
Volume LIV No. 2

SAN FRANCISCO: 1951

IDAHO - FEBRUARY 1951

E. H. Jones, Section Director - Boise

WEATHER SUMMARY

This month was characterized by average temperatures above the February mean in all divisions of the State and by above-normal precipitation, ranging from 124% of normal in the Northern Division to 136% in the Southeast. Temperature departures at individual stations were positive with few exceptions, nearly all in the Northern Division. A somewhat larger number of stations showed negative departures of monthly precipitation, most of them in the Clearwater Basin and in an area extending from the vicinity of Hailey northeastward to the vicinity of Dubois and Spencer. Snowfall, averaged on a statewide basis, was about 97% of the 53-year mean, being above the average of last February but far below the record-breaking snowfall of February 1949. Sunshine was somewhat deficient in western and northern sections but just about normal in the southeast.

The cold spell of late January carried over into February with all but a few Idaho stations recording lowest temperatures of the month on the first; a large majority reported subzero readings on this date. Much of the precipitation of the month fell during the first week, when the principal storm track lay across Idaho. After the first two days of the month temperatures were above normal for a prolonged period, reaching unseasonably high levels throughout the State from the 8th to the 11th. During this 4-day period air was imported from the south and southwest as a deep low pressure center moved inland at higher latitudes and the "Great Basin High" reached its greatest development on the 9th. The early part of the month was also a period of much cloudiness with sunshine noticeably deficient during the first 10 days. During that period the sun shone but a few hours in the Northern Division, and in southern divisions the total sunshine was only about 25% of possible. After the 11th, the remainder of the month brought more typical February weather with frequent, though generally small, temperature changes, occasional strong gusty winds, and frequent occurrences of light precipitation.

The weather of the month apparently had little adverse effect on the economy of the State. Some damage to winter wheat was reported as the result of alternate periods of freezing and thawing early in the month, but a light snow cover provided protection from low temperatures late in the month. Fruit buds were believed to have survived with little or no damage from the cold wave of late January and early February, as well as from the later change to colder, following the midwinter mild spell. Early lambing began during the month with weather conditions generally favorable. Livestock was being returned to lower pastures and ranges by the third week, and a plentiful carryover of hay was reported. The heavier rains of the 4th to 7th sent a few small streams in the Southern Division over their banks, but little or no damage was reported. The month was particularly free from damage due to windstorms; on the basis of records from Boise, Pocatello and Spokane it appears that extreme winds were generally under 35 miles per hour. Mountain snow depths gave promise of abundant water supplies for nearly all irrigation projects.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief,U.S. Weather Bureau,Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index,but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches,and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5,is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

MARCH 1951
Volume LIV No. 3

SAN FRANCISCO: 1951

IDAHO - MARCH 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

For the State as a whole this was the coolest March in nearly 30 years. At every station the average temperature was below the March mean, with departures of more than 5° at many points in the Northern and Southwestern Divisions. Precipitation was much lighter than a year previous yet averaged nearly 83% of the weighted mean, with a fair percentage of stations reporting precipitation totals in excess of the March mean. Snowfall, averaged for the State, was nearly double the 53-year mean and exceeded all records for March since 1917.

From the 2d to the 9th precipitation occurred daily over much of the State, and in the Panhandle Area daily precipitation continued through the 15th or 16th. Near blizzard conditions were common in the southeast portion during the first few days. The 15th was a day of widespread rains throughout the State and one of few days in the first half of the month with temperatures above normal. After the 16th, for a period of nearly two weeks, precipitation was infrequent. But near the close of the month a storm front of the cold type moved across the State, accompanied by general precipitation.

Temperatures were subnormal for much of the first three weeks. In the first week this could be accounted for by marked deficiencies in sunshine and a circulation pattern which brought air from higher latitudes of the North Pacific. During this period the principal storm track lay along, or to the north of, the 50th parallel of latitude while the Pacific Anticyclone was unusually extensive and far to the northwest of its normal position for the season. In the second week an outbreak of continental polar air, out of Canada by way of northern Idaho and western Montana, brought a marked depression of temperatures to all sections of the State. A majority of Idaho stations, particularly south of the Salmon River, recorded the month's lowest readings on the 10th or 11th. At the more elevated stations, where the snow cover was still of some depth, the readings were well below zero, and even at lower-elevation stations most temperatures were between 10° and 20°. Mild spells were infrequent and short-lived, but decidedly in contrast to the deficiencies of 10° to 20° during the colder spells of the first half of the month.

Agriculture was adversely affected by the weather during March. Cold, wet weather delayed plowing, slowed the growth of fall sown grains (which also suffered some damage from alternate freezing and thawing) and delayed shearing of sheep. Lambing, and the general condition of livestock, suffered little; but pastures and ranges were slow in starting spring growth. In general, the agricultural season was several days late and by the close of the month reports from orchard areas indicated only swelling buds with no opened blossoms. At the month's end mountain snow depths and water content were somewhat above those at the close of February, particularly in the central portion of the State. On nearly all projects prospects for irrigation water supplies were very good.

Storm damage was rather light, being confined to the effects of blowing and drifting snow throughout the State on the 4th and 5th, some property damage and bodily injuries due to high winds in Nezperce and Clearwater Counties on the 15th, and the disruption of telephone and electric services due to high winds and wet snow in southwestern counties on the 29th. At Boise a new extreme wind for March of 55 mph was recorded.

Although temperatures were fairly low, rivers and streams ran rather high for the time of year.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief,U.S. Weather Bureau,Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index,but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches,and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5,is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1951

IDAHO - APRIL 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

The outstanding feature of this month's weather in Idaho was the prolonged dry spell, extending from the closing days of March to the beginning of the final week of April in most of the State. For the Northern Division the average precipitation hit a new low for the month in 58 years of record, but late rains brought Southern Division averages close to the long-period mean. All but two stations north of the 44th parallel of latitude recorded subnormal precipitation, while south of that line positive and negative departures were about evenly divided. The average temperature for the month was more than 3° above that of April 1950, but just 1.1° above the 55-year mean. Departures from station mean temperatures were predominantly positive, but mostly small, with greatest departure of about 3° occurring at scattered stations in the south-central and southeast sections of the State. Sunshine was unusually abundant, apparently running 15 to 20 percent above the April mean, and placing this month among the sunniest Aprils on record. Strong winds occurred on several days but little or no damage was reported.

A day-by-day examination of the weather in Idaho during this month reveals warm, sunny weather prevailing throughout the State during the first week. Sunny conditions continued through the second and third weeks in most sections, but during this period two cold fronts moved almost directly from north to south across the State, the first on the 9th-10th, the second on the 19th-20th. Following passage of each front all sections of the State experienced a hard freeze. The first did relatively little damage, because vegetation had not generally reached a vulnerable stage. The second cold period caught fruits at a more critical stage of development and damage to soft fruits reached 80 to 90% of the crop in some south-central areas; extensive heating, however, saved much of the crop in southwestern orchards. First real indications of a break in the drought came on the 19th when stations in the southeast corner of the State recorded fairly substantial amounts of rain. During the ensuing four days scattered light showers occurred in areas south of the Salmon River and on the 24th that same section of the State experienced widespread showers with totals reaching three tenths of an inch or more at a number of stations. The 25th brought light and scattered showers, and on the 26th southern Idaho again had widespread showers, light to moderate in intensity. Finally on the 27th showers fell throughout the State as the forerunner of a storm front from the Pacific. That formation, moving rather slowly, passed eastward beyond Idaho by the 29th; but accompanying it across the State, and within the air mass that followed the storm inland from the Pacific, precipitation was general, and in many areas moderate to heavy. During this period a number of stations in the southwestern division recorded one-day totals in excess of an inch.

Snowfall was much lighter than usual, averaging 0.8 inch for the State,compared to a 55-year mean of 2.6 inches for April. By the end of the month only a few stations reported snow on the ground, although mountain snow accumulations were sufficient to assure plentiful supplies of water for nearly all irrigation projects.

The persistently warm weather of the first week or ten days resulted in rapid snow melt and higher-than-average stages on several streams in the southern part of the State, where near bankful stages were reached about the 15th. The Big Wood, Malad and Port Neuf Rivers reached bankful stages, or a little above, from the 13th to the 15th, occasioning some alarm but causing little or no material damage. Northern Idaho rivers showed substantial increases in flow during the month but remained well below bankful stages.

The prolonged period of dry, sunny weather permitted steady outdoor activities on farms and ranches, but also resulted in such drying of the topsoil in many areas as to retard early growth of hay, wheat, early row crops, and ranges. The principal damage due to weather elements was to fruits, in the hard freeze at the end of the third week.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index,but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches,and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5,is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

MAY 1951
Volume LIV No. 5

SAN FRANCISCO: 1951

IDAHO- MAY 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

Although this month averaged about three and one-half degrees warmer than May 1950, precipitation was again below the 56-year mean. Except in the Clearwater Basin and at a few points in the southeastern division, precipitation deficiencies were moderate and about 30% of the stations reported totals in excess of the mean for May. The greatest excesses in precipitation were recorded at Clark Fork and at several stations in Shoshone County. Sunshine apparently was a little above normal in southern Idaho, but somewhat deficient in Northern districts.

The cool spell of the closing days of April carried over to the opening days of May. A majority of stations in the southwestern division, and about one-third of those in the southeastern division, reported the lowest temperature of the month on one of the first three days, and all but a few readings were freezing or below. During the first two days scattered showers were reported, but precipitation totals were of little consequence, except in the extreme North. From the 3d or 4th through the 11th, temperatures were generally above normal and substantial rains fell in all parts of the State. The principal showery period was from the 6th to 8th, during which a low pressure trough, slowly moving eastward, was followed by moist air from off the Pacific. These showers improved soil moisture and were generally beneficial to ranges. pastures and dry farms. The next period of extensive shower activity began on the 11th, as a slow-moving storm center, and its attendant cold front, passed inland across the State. Pronounced temperature drops were felt in all sections by the 12th, but no frosts were reported as cloudy skies prevailed throughout the State. The showers ended in southern divisions on the 13th, but continued another day in the North. Scattered light frosts occurred on the morning of the 14th, as skies began to clear. A return to generally sunny and moderately warm weather during the following 10 days to 2 weeks brought the best growing weather of the season to date, and farming operations were hampered but little by the scattered light showers. Highest temperatures of the month were recorded at nearly all stations in the State between the 22d and 28th. Southern sections received fairly good rains during the last 4 or 5 days of the month and soil-moisture conditions were improved, particularly in south-central and southeastern areas. A cold air mass, originating over regions far to the North and Northwest, moved in on Idaho at the close of the month and subnormal temperatures were general on the last 2 or 3 days. Clearing, or partial clearing, of skies at night resulted in freezing temperatures on the mornings of the 28th, 29th and 30th at many points in the northern and southwestern divisions. For the most part crops were just nipped by the freeze, but some tender garden vegetables were killed and some fruit crops suffered further damage. Despite some frost damage and some crop injury by hail (principally on the 27th), the effects of weather on the economy of Idaho were about normal for May, but crop development was still about a week late at the close of the month.

Storm damage was principally caused by hail. About a dozen stations in southwestern Idaho reported small hail on the 27th; the largest hail stones apparently fell on the north side of Camas Prairie where the observer at Fairfield reported stones averaging 1/2 inch in diameter with the largest about 2 inches. Reports indicate damage to hay, roof tops, and window glass. Minor hailstorms occurred in Oneida and Lincoln Counties on the night of the 7th and in Canyon County on the 12th.

Rivers and streams of the Snake system made secondary crests on the 17th. Bankful stages were not even approached on the lower Snake and tributaries. On the upper Snake and tributaries, flows were near levels previously considered dangerous but were held in check by recently constructed dikes and by careful distribution of the water in irrigation canals. All the larger reservoirs were at capacity as the month closed.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25.000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

JUNE 1951

Volume LIV No. 6

SAN FRANCISCO: 1951

IDAHO - JUNE 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

In contrast to June 1950 in which the statewide precipitation was well above normal, this month had only 58% of normal rainfall. Only twice in the past 15 years has Idaho experienced drier weather in June; the statewide average was 0.65 inch in June 1949 and 0.66 in 1940, compared to a 0.92 this month. The average number of days with measurable rain for all stations was five this month, compared to four in 1940 and 1949. Except for a few in the upper portions of the Boise and Payette Basins, and several in the Northern Division, individual station totals were below normal, with departures exceeding 1 inch at several points. All stations in the State reported average temperatures below normal and the statewide average shows this to be the coolest June since 1947, with a departure of -3.2°. Sunshine was normal or a little below in the northern part of the State, but in southern sections the percentage of possible sunshine was well above the mean for June.

In all sections of the State the major portion of the month's rainfall came during the first two weeks. This was particularly true in the southern divisions where scattered showers from the 22nd to the 24th constituted nearly all of the rainfall after the 13th. A study of the weather maps for June shows that during the first two weeks a trough of low pressure lay over, or to the west of Idaho most of the time. Over the Northeast Pacific Ocean a large high pressure system remained nearly stationary, somewhat north of its usual position at this season. To the east of the Columbia Basin pressure was generally high also, with recurrent outbreaks of cool air from Canada sweeping southward through Montana and occasionally spilling westward into Idaho. This type of weather pattern accounts both for the shower activity of the early part of the month, and the subnormal temperatures throughout the State for about the first ten days. After the first two weeks the Pacific high extended inland over western Canada and the states on the Pacific Northwest. This pressure pattern produced generally dry weather with occasional southward thrusts of cool air. A breakdown of the high pressure ridge, beginning on the 21st, allowed a migratory low pressure system, or storm center, to pass southeastward across most of the State, bringing widespread showers to the Northern and Southeastern Divisions, and scattered light showers to the southwest. The high pressure area replacing the low center brought with it the final, brief cool spell of the month. By the 30th the weather map had assumed an appearance typical of the hot, dry weather of midsummer in Idaho.

The cool weather that carried over into June following the frosts of late May, temporarily retarded growth of nearly all crops in the State, including range grasses and pastures. Frosts on the morning of the 7th, striking heavily in the Magic Valley of south-central Idaho, and at scattered points in northern and southeastern districts, caused sufficient damage to beans to necessitate some replanting, definitely retarded growth of potatoes, and caused light damage to dry peas in northern areas. The relatively dry weather of the latter half of the month, coupled with abundant sunshine, particularly in the southern sections, resulted in rapid growth and by the close of the month all crops had recovered sufficiently to be about up to normal for the date, with prospects of good yields. In southwestern Idaho the rainfall deficiency of the latter half of the month necessitated heavy use of irrigation water.

Storm damage during June was very light, according to available reports. The only reported damage occurred on the afternoon of the 6th when light hail fell at scattered points in the Southwestern Division.

The seasonal snow melt proceeded more or less uneventfully. Flow on the upper Snake, and particularly below the confluence of the Snake and Henrys Fork, reached a peak on the 17th to 19th, but new dikes plus careful distribution of water in irrigation systems prevented flooding. By the 20th the river stages indicated that the mountain snow pack was reduced beyond the point where high water would again be a threat this season.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

JANUARY 1950	Dubois 5 NE Exp. Station, precipitation on 2nd should be Trace, monthly total .93 and departure -.02.
JUNE 1950	Minidoka Dam, min. temperature on 29th should be 60°
DECEMBER 1950	Winchester 1 SE, delete snowfall amounts, should be no record.

IDAHO

JULY 1951
Volume LIV No. 7

SAN FRANCISCO: 1951

IDAHO - JULY 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

July temperatures averaged more than 2° above those of the previous year and higher than in any July since 1947. The statewide precipitation average was very near that of last year and also close to the 59-year mean, but the Southeastern Division recorded the highest July average since 1941. Sunshine was noticeably below the mean for July, particularly in the southeastern part of the State. Despite considerable thunderstorm activity, little damage was reported, either from wind or hail, and in general winds were lighter than usual for July.

For the most part rainfall in the northern and western portions of the State was confined to the first ten days of the month, while in the southcentral and southeastern areas the heavier showers occurred in the final week or ten days. During the month only two well-defined storm fronts crossed the State. The first crossed the western border during the evening of the 3d and by forenoon of the 4th had passed eastward beyond the State; the second moved southward throughout the length of State between the evening of the 9th and the evening of the 10th. Both storm fronts were accompanied by rather widespread shower activity and drops in temperature. From the 23d through the remainder of the month temperatures ran above normal in all sections and the fire hazard increased rapidly, especially in the forests and ranges of the Southwestern and Northern Divisions. During this period the circulation over the State was principally from the south and southwest, in contrast to the early part of the month when the circulation pattern was more changeable and west to north winds were observed at upper levels on several occasions.

The July weather was generally very good for crop growth in irrigated sections of the State, but in some dry-farm areas the moisture was insufficient for full development of spring-sown grains. Intense heat during the latter half of the month necessitated heavy use of irrigation water and caused rapid drying of lower ranges; in southcentral areas beef cattle were moved from desert ranges to irrigated pastures and feed lots. Dairy production fell below normal during the month because of poor pasture conditions in many sections. Harvesting of fall-sown grain was started during July, but the hot, dry weather caused such rapid ripening that yields were somewhat reduced. Sugar beets made excellent progress, while potatoes and beans were doing well.

Rivers and streams in most sections of the State dropped slowly during the month, with remarkably good flow for the time of the year, and irrigation water supplies were ample in nearly all sections.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per ear to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
R	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
S	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
R	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1951

IDAHO - AUGUST 1951

E. H. Jones, Section Director, Boise

WEATHER SUMMARY

Statewide averages for the month indicate that August 1951 was a wet and comparatively cool month. The Northern and Southwestern Divisions received more rain than in any August since 1941, and in the Southeastern Division the average was greater than in any year since 1930, and the second highest for August since records were begun in 1893. Despite this, the Northern Division experienced a prolongation of the drought which began in early July and ended only in the final four days of August. All Northern Division stations recorded their greatest daily rainfall between the 28th and 30th with at least one station, Porthill, reporting its greatest daily rainfall on record for August. In the southeast and south-central portions of the State new record daily totals for August were recorded at a number of stations, among them Hill City, Twin Falls 3 SE, Hamer, Island Park Dam, Paul, Ririe, St. Anthony, Sugar and Tetonia. Sunshine was generally less than normal with a marked deficiency in the eastern part of the State; at Pocatello the percentage of possible was only 60% compared to a long-period mean of 78% for August. Storm damage, from hail and rain,was noticeably greater than in August 1950, particularly in the eastern part of the State. Winds caused little or no damage.

During the first week of August there were scattered thunderstorms and showers which brought light to moderate rains to southern Idaho, with an occasional report of an inch or more. From the 10th to the 20th there was very little rain anywhere in the State, sunshine was plentiful in most sections, and temperatures rose to levels well above normal between the 15th and 20th. A cold front moved across the State from north to south on the 22d, preceded, accompanied and followed by showers and scattered thunderstorms and bringing a drop in temperature to nearly all of the State. The outstanding storm front of the month entered the northern tip of the State on the evening of the 27th, moved slowly southward and southeastward, and finally passed out of the southeast corner of the State on the evening of the 29th. It was this front that touched off the period of heavy showers in northern Idaho, and brought a sharp lowering of temperatures to all of the State, with maximum temperatures dropping to the seventies or high sixties, and minima to the forties during the final days of the month.

The effect of weather on Idaho's agriculture during August was somewhat negative in the northern part of the State because of the drought during most of the month, which dried pastures and ranges, and retarded crop growth in some localities. Other detrimental effects of the weather on crops were largely confined to the hail and rain damage which seems to have been concentrated in a broad strip running eastward from Blaine County to Fremont County. Crop damage was probably in excess of $200,000. On the positive side of the picture, we find that crop growth was generally good, with ample moisture in dry-land farming areas of the eastern part of the State, and that higher range lands continued to provide good feed. Much grain harvesting was accomplished during the month and harvesting of fruits was begun. Forest fires and grass fires were unusually few in southern portions of the State, mostly because of the copious rains. In the Southeastern Division every station reported a rainfall total in excess of the August mean, with some stations recording totals equal to about three times the mean. In the Southwestern Division the precipitation totals were also in excess of the mean, except at a few scattered stations in the Snake River and Boise Valleys, but excesses in this Division did not approach those in the Southeast.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

IDAHO

SEPTEMBER 1951
Volume LIV No. 9

Beginning with the October, 1951, issue of Climatological Data, Table 4, Hourly Precipitation, will be discontinued due to curtailment of the funds necessary for the processing and publication of these data.

SAN FRANCISCO: 1951

IDAHO - SEPTEMBER 1951

D. J. Stevlingson, Acting Section Director, Boise

WEATHER SUMMARY

This was a very dry September in most sections of the State but temperatures averaged close to normal. Positive precipitation departures were recorded at only 10 stations, all in Shoshone, Bonner and Boundary Counties, while more than 30 stations in southern sections reported no rain for the entire month. Only two Septembers since 1893 have been drier in the Southeastern Division and only five in the Southwestern Division. Sunshine was well above normal in southern portions of the State but somewhat deficient in the extreme north. Winds were lighter than usual for September and no storm damage was reported.

Storm fronts during September were relatively weak as they moved across Idaho. In the Northern Division frontal action was more pronounced than in the Southern Divisions, as shown by the more frequent and heavier precipitation. There was no day during the month when showers occurred generally throughout the State, and only a few days with widespread shower activity affecting two of the three divisions. In the north the principal rainy days were the 11th, 25th and 30th, and on either one or the other of the latter two days the heaviest rain of the month was recorded at every station in the division. The 11th was also a day of considerable shower activity in the Southeastern Division, in fact the only day with widespread showers. In the southwest the only day with widespread showers was the 25th. The period between the 11th and the 25th was one of generally warm, dry weather, particularly in the southern portions of the State. The 14th to the 19th was an especially warm period with a majority of stations recording daily maximum temperatures ranging upward from 75° into the nineties, and minimum readings in the forties and fifties. A cold front that pushed into the State from the north on the 19th caused little precipitation, but did bring a very noticeable drop in temperatures, with subzero readings reported from the Southeastern Division and from higher elevations in other portions of the State. Another cold front, this one from the northwest, moved through the State on the 25th and was followed by widespread early morning freezing temperatures on the 26th and 27th. As a consequence, by the end of the month nearly all sections of the State had experienced at least a light frost.

From the standpoint of the agricultural economy of Idaho, September 1951 was a generally favorable month. The dry weather permitted almost uninterrupted harvesting operations, but lack of soil moisture caused some delay in soil preparation and fall seeding. Prune harvesting was completed and apple picking begun. Some alfalfa and clover seed crops were being harvested. Beans were mostly harvested and threshed by the close of the month, while second and third crop hay harvest continued. Corn canning was about complete and digging of late potatoes was well under way, particularly where vines had frozen. Sugar beet harvesting was just starting at the end of the month. Range conditions in lower elevations were below normal, causing some shrinkage in cattle and sheep while moving down from higher ranges.

Although rainfall was light in southern Idaho, the fire hazard did not reach extreme stages in the forest areas because of the copious rains in August and the relatively light winds during September. Lower range grasses were still dry enough to constitute a distinct fire hazard, but absence of strong winds helped to prevent large conflagrations.

DJS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief,U.S. Weather Bureau,Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

IDAHO

OCTOBER 1951
Volume LIV No. 10

Beginning with the October, 1951, issue of Climatological Data, Table 4, Hourly Precipitation, will be discontinued due to curtailment of the funds necessary for the processing and publication of these data.

SAN FRANCISCO: 1951

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Compared with the warm October of 1950, this month was very cool. The statewide average temperature was 5.4° below that of the preceding October and 2.7° below the weighted normal. On the basis of all available precipitation records this was the wettest October for the State as a whole since averages were begun in 1893. In the Northern Division only two Octobers have been wetter and in the Southwestern Division only three. Without exception stations throughout the State recorded average temperatures below the weighted normal. Precipitation totals, however, were a little less than the mean at a group of stations from Bliss eastward to Pocatello, southeastward to the Utah border and northward to Arco and Howe. Elsewhere precipitation departures ranged upward to more than five inches above normal at a number of stations in the northern and southwestern divisions. Clark Fork recorded the extremely high precipitation total of 10.12 inches for the month, while a number of other stations had totals exceeding eight inches.

As would be expected in a month of heavy precipitation, the number of days with measurable rain was well above the mean, averaging 17 days out of the month for all Northern Division stations, 10 days for the Southwestern Division and 9 days for the Southeast. Snowfall, too, was well above the weighted normal and more than three times the average depth during the month of October 1950. Sunshine, of course, was deficient; on the basis of records from Weather Bureau Offices at Spokane, Washington, Boise and Pocatello, deficiencies ranged from somewhat less than 10% in the southwest to around 25% in the north. At Spokane the total sunshine for the month was only 28% of possible, while at Pocatello it totalled 49% and at Boise 59% of possible.

Rains that began toward the end of September increased in intensity early in October and by the 2nd and 3rd all sections of Idaho received moderate to heavy amounts. In the Southwestern Division this was particularly noticeable with about one-half of the stations reporting the greatest daily amount on the 2nd. Several stations reported more than one inch of rain in 24 hours. This stormy period, which lasted through the 4th, was associated with rather slow eastward movement of a low pressure center along the Canadian Border. Northwesterly winds brought to the northwest states an air mass that had become moist and unstable as it traveled long distances southeastward over the Pacific Ocean. The rainy spell diminished to scattered showers on the 5th and then gave way to a period of generally fair weather that lasted four days. Temperatures generally were several degrees below the seasonal normal from the 2nd through the 6th, rising during the subsequent fair-weather period, reaching values of 10° to 15° above normal in most parts of the State. Almost without exception stations throughout Idaho recorded the highest temperature of the month between the 7th and the 10th. Between the 10th and the 15th three storm fronts from the Pacific crossed Idaho from west to east, bringing widespread showers to all sections. The first of these reached western Idaho on the evening of the 10th and traversed the State from west to east in a little more than 12 hours. It was very effective as a shower producer in all sections, with numerous thunderstorms reported in the Northern and Southwestern Divisions. Noticeable lowering of maximum temperatures accompanied this showery period, but minimum readings remained above freezing at most stations until the 15th or 16th when partial clearing of the skies brought sharp drops in nighttime temperatures. The seven day period from the 18th through the 24th again brought widespread precipitation. For much of this period showers occurred without any definite storm fronts moving through the State. But finally, a cold front entered the northern tip of the State during the forenoon of the 23rd, and moved southeastward across all of Idaho within 36 hours. Amounts of rain were variable, but several stations in each division reported the greatest daily fall of the month on either the 23rd or 24th, and some of the amounts exceeded 1.50 inches. This week of showery weather was relatively cool with very little sunshine and light to moderate winds. The final week of October brought only scattered light precipitation to Idaho but a mass of cold air slowly moved southward out of Cadana and covered all of the State, with temperatures falling to the lowest levels of the month at most stations on the morning of the 31st.

Agricultural activities were frequently hampered by wet weather during the month. Soil preparation and the sowing of fall grains were delayed in nearly all parts of the State; grains that were planted, however, benefited from the moisture. Sugar beet harvesting suffered considerable delay, particularly in southwestern districts, but the favorable weather of the final week permitted extensive digging and hauling. There was some loss to alfalfa seed, clover seed, dry beans and late hay on the ground, but grazing conditions on lower ranges and pastures improved, resulting in slightly improved condition of cattle and sheep.

The month was surprisingly free from damaging storms. The only reported damage of consequence occurred with high winds that visited Lincoln County late in the afternoon of the 10th. Crop losses from this windstorm were estimated at $3500.

DJS

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951. RECORDS.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

/ Gage is equipped with a windshield.

R This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

S This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

Y Includes total for previous month.

R This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NOVEMBER 1951
Volume LIV No. 11

SAN FRANCISCO: 1952

IDAHO - NOVEMBER 1951

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

This November was much cooler than that of the past two years with average temperature only slightly above that of November 1947 and 1948. A few scattered stations in the Northern and Southwestern Divisions showed small positive departures, but a large majority reported deficiencies; negative departures of more than 4° were reported from a few stations in the Southeastern Division. Precipitation was only a little below normal for the State as a whole, and similar to 1950 and 1949 in that respect. Division averages indicate 83 per cent of the November mean in the Northern, 109 per cent in the Southwestern, and 77 per cent in the Southeastern. Snowfall averaged somewhat above the November mean for the State, although well below such Novembers as those of 1942, 1945 and 1946. The average number of days with measurable precipitation was close to the November mean, but available records indicate a moderate deficiency of sunshine throughout the State. Average wind speed apparently was a little less than usual, and no reports of destructive storms were received.

The generally fair weather of late October carried over into November, particularly in southern portions of Idaho where very little precipitation fell during the first ten days of the month. Temperatures averaged generally below normal during the first few days, with freezing temperatures each morning in all parts of the State. Daytime temperatures were relatively mild, however; and with drying soil, sugar beet harvesting increased rapidly during the opening days of the month. Clover and alfalfa seed threshing and apple picking were resumed and nearly completed during this period.

Wet weather between the 11th and 15th again delayed late field work, but during the next four days fair, though cold, weather permitted further progress in harvesting. By the time the next rainy spell began, on the 20th, less than 15 per cent of the sugar beet crop remained in the fields, few apples were left unpicked, and all but a few scattered patches of clover has been threshed. The final week of November was rather mild, but precipitation was frequent and widespread fresh to strong winds prevailed. Snow cover was pretty well confined to elevations above 5,000 feet at the close of the month.

Despite some interference from rains and early morning freezes, late harvest operations were carried on successfully. There remained undug, however, perhaps 10 per cent of the sugar beet crop. Moisture was sufficient to be beneficial to fall-sown grains which, in general, were in good condition.

DJS

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER, 1951, RECORDS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
/	Gage is equipped with a windshield.
R	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
S	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
R	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

IDAHO

DECEMBER 1951

Volume LIV No. 12

SAN FRANCISCO: 1952

IDAHO - DECEMBER 1951

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

This was among the colder Decembers on record in Idaho with an average temperature nearly 10° lower than in December 1950, and 3.7° below the 59-year mean. Since 1932 only one December, 1948, was colder, and the extreme of -40° recorded at Elk City on the 24th is the lowest reported December temperature in Idaho since 1924. Precipitation exceeded the statewide 59-year mean by 67 percent and was greater than in any December since 1942. Average snowfall reached the unprecedented figure of 36 inches, more than three times the average for December 1950 and nearly seven inches above the average for the memorable December of 1948. Sunshine was below the December mean with the deficiency particularly noticeable in southern portions of the State. At Pocatello the sunshine for the month totaled only 15 percent of possible, compared to a long-period mean of 42 percent, and at Boise the total was 28 percent compared to a mean of 40 percent.

For the third successive month temperatures were below the long-period mean throughout the State and the accumulated precipitation totals for the three months were generally well above the mean. In the Panhandle, and in the mountain areas of the Southwestern Division, the precipitation excess was particularly great and the mountain snowpack in those areas was unusually heavy.

Examination of the day to day weather records for the month of December reveals a greater than usual number of days with precipitation and no period of what might be called fair weather throughout the State. Sunshine records show that Boise had only three days during the month with more than 75 percent of possible sunshine, Pocatello had no day with more than 66 percent and Spokane, Washington one day of 81 percent and only three other days above 60 percent. Several times during the month little or no sunshine was recorded at any of the three stations for two or three days in succession. Periods of heaviest precipitation were the 1st to 5th, the 18th, the 22nd to 24th, and the 27th to 29th. Temperature records show only two mild spells during the month; the first extended through the first four days and the second ran from the 27th through the 29th in most sections, although in the northern part of the State this latter period was not very pronounced. All but a few stations reported the highest temperature of the month on the 1st, but the lowest readings of the month were not so concentrated. The 8th and 9th saw most stations in the Southwestern and Southeastern Divisions register the lowest temperature, while in the Northern Division a majority registered the low for the month on the 24th, a day which also brought forth the lowest reading at several stations in the Southern Divisions. The heavier snowfalls of the month, for the State as a whole, appear to have been those of the 16th to 18th, the 21st and 22nd and the 29th.

Reports indicate little or no storm damage during December in Idaho, but the frequent snows, combined with occasional periods of strong winds, caused drifting in many areas with resultant intermittant closing of portions of major highways. As usual for the season, farming activities were largely confined to the care of livestock and there were no reports of losses or undue hardships. Supplemental feeding was heavy, but cattle and sheep maintained their good condition.

DJS

December reports received subsequent to preparation of the several tables but prior to publication will be found in the "DELAYED DATA" tables.

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951 RECORDS.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

ANNUAL INDEX 1947 through 1950	Length of record data for Centerville Arbaugh Ranch, Crouch, Idaho City 13 SW, Ola, Shoshone, Sun Valley, Swan Falls, Three Creek, Twin Falls 2 NNE, Twin Falls 3 SE are in error. See 1951 Annual Index for corrected data.
APRIL 1951	Swan Falls PH, min temperature on 29th should be 40 and 30th, 41. Mean min should be 41.4, monthly mean 56.4, departure 2.4 and total degree days 281.
AUGUST 1951	Ola, record for this station should be under the name of Ola 4 S.
SEPTEMBER 1951	Nezperce, record for the last fifteen days of the month should be under the name of Nezperce 2 E. Delete all summary data.

SAN FRANCISCO: 1952

IDAHO - ANNUAL - 1951

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Dominant features of the year's weather in Idaho were the cold weather of March and June, the dry weather during much of April, the unusually heavy August rains, particularly in the Southeastern Division, and the generally wet, cold weather of the last three months. Annual precipitation totals were above the long-period mean at a majority of reporting stations, largely because of the heavy precipitation in October and December, but one well-defined area of deficiency included the Clearwater Basin. In the higher elevations of Eastern Idaho annual totals exceeded the mean by moderate amounts, and the same was true of the Panhandle area, but the most notable excesses appeared in the mountainous areas of the Southwestern Division. All but a few scattered stations showed average annual temperatures below the long-period mean, and the records reveal only one month, February, in which all division averages were definitely above the mean. The winter months of 1951 brought no prolonged periods of extremely cold weather, such as were experienced in January 1950, and to an even greater degree in January 1949. On the other hand, the low average temperatures of October, November and December 1951 contrasted sharply with the mild weather of those months in 1950. Irrigation water supplies were generally ample at the beginning of the season with all reservoirs filled to capacity.

The principal adverse effect of the weather on the agricultural economy of Idaho may be summarized as follows: Damage to soft fruits due to freezes in April, resulting in about 30 percent reduction in yield; some damage to fall-sown grains because of lack of protective snow cover during part of January and February, which combined with frosts early in June to reduce wheat yields; the hot spell in the latter half of July which resulted in a rough potato crop with quality lower than in many years; hail damage to crops totalling $200,000 in August; and the adverse weather of autumn which resulted in loss of some alfalfa and clover seed and about 90,000 tons of sugar beets. Favorable effects of the weather were: The warm dry spell in April, following a cool wet March, which greatly aided soil preparation and planting; the general absence of long hot, dry spells during the summer with the result that forest fires in southern Idaho were neither as extensive nor as numerous as in many past years; the dry weather of September which permitted almost uninterrupted harvest operations; and the heavy snows of December which, following above-normal precipitation for the two preceding months, provided a good start toward adequate water supplies for the next season.

Only one fatality was reported as directly attributable to weather; a man was killed by a falling tree when strong winds felled numerous trees in the vicinity of Coeur d'Alene on January 15th.

SYNOPSIS BY MONTHS

JANUARY: Fairly typical January in Idaho with temperatures averaging close to normal in all divisions, although individual station averages varied from nearly 5° below to 5° above the mean. Precipitation was slightly above the January mean in all divisions and snowfall was nearly 140% of the mean. Weather was generally favorable for livestock and agriculture, although alternate freezing and thawing did some damage to fall-sown grains on lands that remained bare.

FEBRUARY: Relatively mild with precipitation above and snowfall slightly below the mean. Sunshine somewhat deficient in Southwestern and Northern Divisions. Alternate freezing and thawing early in month caused slight damage to winter wheat. Early lambing began with generally favorable weather. Livestock was moved to lower ranges and pastures, toward close of month.

MARCH: An unusually cool March, averaging more than 4° below the mean for the State. Precipitation much lighter than in March 1950, and 83% of the March mean. Snowfall nearly double the mean and heavier than in any March since 1917. Cold wet weather delayed spring plowing, retarded the growth of fall-sown grains an delayed sheep shearing. Pastures and ranges were slo in starting growth.

APRIL: A drought of more than three weeks duratio resulted in a new low for April precipitation in th Northern Division, but rains late in the month brough the totals reasonably close to the mean for the Southwestern and Southeastern Divisions. Temperatures averaged a little above the April mean and sunshine wa unusually abundant. Snowfall was very light. Th weather was very favorable for farming activities an much soil preparation and planting were accomplished Some fruits were damaged in the hard freeze at the en of the third week.

MAY: Temperatures averaged near the mean and precipitation somewhat below. Farm activities progresse about as usual for the season and showers were frequent enough to be beneficial to pastures, ranges, an dry farms. Freezing temperatures late in month nippe some crops, including fruits, and killed tender vegetables in some localities.

JUNE: A dry month with only 69% of mean rainfal and cooler than usual. Most of the rain fell durin the first two weeks. During the latter half of th month warmer weather and abundant sunshine brough rapid plant growth, with crops about up to normal a close. Frost did considerable damage in Magic Valle on the 7th and scattered damage elsewhere.

JULY: Fairly typical July with temperatures averaging near the mean, but with rainfall the heavies in ten years in the Southeastern Division. Hot, dr weather of the latter half of the month caused rapi ripening of grain, and drying of pastures in some sections, but in general the month was favorable for cr growth and for farm activities, although potatoes we adversely affected.

AUGUST: Wet and cool with Northern and Southweste Divisions recording more rain than in any August sin 1941 while the Southeastern Division had the heavies August rains in more than 20 years. Despite high monthly totals, however, the Northern Division suffered drought through most of month, resulting in drying pastures and ranges, and general retardation of cr growth. Crop damage by rain and hail was high in central and eastern areas.

SEPTEMBER: A dry month with temperatures near normal. The weather favored harvesting, but drying t soil delayed soil preparation and fall seeding. Low ranges were below normal.

OCTOBER: A cool, wet month with statewide preci itation averaging higher than in any October since records were begun in 1893. The wet weather caused mu delay in harvesting of sugar beets and also in t preparation of soil and sowing of fall grains. Low ranges and pastures improved, but there was some lo of alfalfa and clover seed, beans and late hay. Su shine was noticeably deficient.

NOVEMBER: Temperatures averaged about 2° below t November mean; precipitation averages showed only sma negative departures. Snowfall was above the mea Favorable weather early in the month permitted harve operations to be brought near completion, includi sugar beet digging, apple picking and the threshing some clover. Fall-sown grains were generally in go condition.

DECEMBER: Among the coldest Decembers on reco in Idaho; nearly 10° colder than December 1950 a 3.7° below the 59-year mean. Precipitation was 16 above the mean with record average snowfall of 36 inc es. Cattle and sheep maintained good condition b heavy supplemental feeding was necessary. At the e of the year the mountain snowpack was unusually heav after three cold wet months.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

NAME CHANGE

FORNEY BLACKBIRD MINE	Changed to	COBALT BLACKBIRD MINE	July 1951

Unless otherwide indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured on the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

-	No record.
+	Also later date (dates) or months.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to full month.
E	Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch of water equivalent to every 10 inches of new snowfall.
M	1 to 9 days' record missing; see monthly Climatological Data for detailed daily record.
R	Station equipped with a recording gage only.
T	Trace, an amount too small to measure.
V	Includes total for previous months. V in annual column means total is for a two-year period.
S	Storage precipitation station. Will be published in the June, July and August or delayed data December issue of Climatological Data.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

IDAHO

JANUARY 1952
Volume LV No. 1

SAN FRANCISCO: 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

This month was colder than January 1951 and average temperatures were below the long-period mean in all divisions. Precipitation was somewhat greater than a year ago and also above the January mean in the Southwestern and Southeastern Divisions, but considerably lighter than in January 1951 and a little below the mean in the Northern Division. Snowfall, averaged on a statewide basis, was well above the mean and about six inches above last year, but still eight inches short of the record-breaking snowfall in January 1950. There was a deficiency of sunshine in all parts of Idaho, while the number of days with measurable precipitation exceeded the January mean. Few extraordinary 24-hour totals were reported, the general excess of precipitation for the State resulting from frequent light to moderate falls of rain or snow. Average wind speed was near the January mean, and although high winds were reported on a number of days, damage was light.

Several marked temperature changes occurred during the month, but there was only one pronounced cold wave. In the Southwestern and Southeastern Divisions, between the morning of the 16th and the morning of the 17th, minimum temperatures fell an average of 20° to 25°, with a few stations reporting drops of 35° to 40°, and all but a fe reporting minimums of zero or lower. Th drop in temperature came in the wake of general snowstorm, as the area of low pressure, or storm center, was rapidly displace eastward and a high pressure cell, wi clearing skies and diminishing winds, move over Idaho. During the snowstorm precedi the cold wave a number of stations in southern Idaho reported snowfall of from eight to nearly twenty inches.

The 10th was another day of heavy snowfall, this time striking the Northern a Southwestern Divisions, but this storm w not followed by clearing skies and loweri temperatures. A number of stations report the heaviest daily precipitation of the mon on the 10th, but a greater number report the heaviest on the 15th and 16th, or on t 23rd, 24th, and 25th.

All in all this was not an unusual severe January in Idaho and adverse effec of weather on the economy of the State we small. On the other hand, the steady i crease in the mountain snowpack gave promi of ample water supplies in all areas.

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951, RECORDS

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1952

IDAHO - FEBRUARY 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

February 1952 marked the fifth consecutive month with average temperatures below normal in Idaho. Temperature deficiencies were particularly marked in the Southwestern and Southeastern Divisions, where every station reported an average temperature below the long-period mean, and the division averages were 5.7° below the mean. In the Northern Division stations from Lewiston and Orofino northward were generally a little above normal, but for the division as a whole the departure from the mean was -0.8°. This places the month in sharp contrast to February 1951 when, with few exceptions, average temperatures were above the mean at stations throughout the State. On the basis of the statewide average temperature this February ranks as the coldest since 1939, and the coldest since 1936 in the Southwestern Division. Precipitation for the entire State averaged just .01 inch below the 56-year mean, even though the average for the Northern Division was the lowest since 1941. Very few stations in the north reported totals above the 56-year mean, but in the southern divisions excesses were reported in the following drainage systems; the Weiser River, the Wood Rivers, the middle portion of the Snake, Henry's Fork, Lost River and portions of the Payette and Salmon Rivers. Snowfall was considerably heavier than in February 1951 and 1950, but only a little more than half the total in the record-breaking February of 1949. Sunshine, as indicated by records from Boise and Pocatello,was a little above the February mean over the southern portion of the State, but on the basis of Spokane's (Washington) records it appears that there was a deficiency of sunshine in northern Idaho.

The opening days of February 1952 gave hope of relief from the long winter, but in the southern divisions, at least, the relief was short-lived. For the first five or six days temperatures were above normal, settling back to near normal for several days thereafter, and finally dropping well below normal about mid-month and continuing generally subnormal throughout the remainder of the month. In southern portions of the State the latter half of the month was among the coldest of such periods on record.

Widespread precipitation accompanied the relatively mild weather of the first four days in February, but thereafter for a full week only a few very light amounts were reported in the State. The next ten days brought frequent precipitation to all parts of the State with the heaviest falls generally occurring on the 16th and 17th. Those two days produced some of the heaviest snowfall of the month in all sections. During the final week precipitation was light.

Although winds averaged below the mean for February, there were a few days on which strong winds were reported and in some sections of the State there was extensive drifting of the relatively dry snow. Some communities, among them Fairfield and Shoshone, were forced to close the schools for several days. Main highways were generally kept open, but side roads were drifted shut much of the time.

Farming activities were confined mainly to care of livestock. No losses were reported but some observers remarked that the weather had been "tough on livestock and feed".

Property damage due to weather conditions appears to have been light and confined mainly to occasional disruption of telephone and power facilities.

Although the average snowfall for the State this February has been exceeded several times in past years, the accumulated snowpack at the end of the month was of record-breaking proportions in many of the mountain areas, particularly in the Southwestern Division. Not only do irrigation projects seem assured of ample water supplies, but on many streams there is a definite threat of flooding.

DJS

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER 1951. RECORDS

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MARCH 1952
Volume LV No. 3

SAN FRANCISCO: 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With average temperature for the State 5.6 degrees below the long-period mean, this March was among the coldest on record for Idaho, and it climaxed one of the longest winters since statewide records were begun nearly sixty years ago. For the sixth successive month temperatures averaged below the mean in all divisions and during that six-month period snowfall averaged above the mean in all months. The average snowfall for the State this month was 13.8, compared to a 53-year mean of 7.4 inches. For the six-month period ending with March 1952 the average total snowfall for Idaho was 104.7 inches, compared to a 53-year mean of 55.7 inches for October through March.

Every station in the State reported an average monthly temperature below the March mean with departures of -10° or more in the Pahsimeroi and Big Lost River Valleys. Precipitation totals were below the March mean at all but one Northern Division station and at a majority of those in the southwest, but the Southeastern Division showed an excess for the fourth consecutive month. Snow accumulations at intermediate and higher levels were unusually large in most river basins of the two southern divisions, with heavy runoff on a few streams late in the month.

Although general precipitation covering the entire State occurred in 2 or 3-day periods at intervals throughout the month, there was hardly a day when precipitation did not occur somewhere in Idaho during March 1952. Examination of the daily weather maps reveals that a majority of the storm centers, or low pressure areas, moving onto the continent from the Pacific, travelled southeastward. Some of the centers moved inland across northern California, Nevada and Utah, giving relatively light and scattered precipitation to Idaho. Others moved southeastward at higher latitudes with more direct effect on the weather in Idaho. Three storm systems were particularly effective in bringing general precipitation to the State. The first was a low that appeared over Vancouver Island on the evening of the 9th. From this a trough developed southeastward across Idaho by the morning of the 10th. The center was over Butte, Montana, the evening of the 10th with a trough extending southwestward into Nevada. By the morning of the 11th the center was over central Wyoming and by evening it had progressed to southeastern Wyoming with precipitation gradually subsiding in Idaho. Snowfall was general during this storm period, although some stations at lower elevations received little or none. The next general storm period, from the 18th through the 20th, occurred with a low pressure center moving southeastward across western Canada through Montana into eastern Wyoming. The cold front from this center trailed southwestward and westward and much of the precipitation that occurred in Idaho was associated with the passage of the front. The third period of general precipitation affecting the State came on the 23rd and 24th as first a storm front aloft, and later a surface front, moved eastward. In these later storm periods snow was also reported at many stations, but in general it was not so widespread nor so heavy as in the storm of the 10th and 11th.

Relatively mild weather during the fourth week in the Northern and Southwestern Divisions resulted in disappearance of the snow cover at lower levels, but intermediate and higher elevations generally had snow on the ground at the end of the month. As a consequence, little was accomplished in spring field work and planting, except in the low elevation agricultural areas where some work had been done. Cattle, in most areas, were still on feed lots. Fruit trees had not yet begun to produce buds, and in general the season was definitely retarded throughout the State.

No runoff from melting snows occurred at higher elevations and heavy runoff from lower levels during this month was confined to a few streams. There was some inundation of farm lands along the Weiser River where the flow reached a peak on the early morning of the 31st, but damage appears to have been slight. Ample irrigation water supplies were assured for all projects and, in fact, there was considerable concern about the possibility of damaging overflows during the spring along many streams.

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER, 1951, RECORDS.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO - APRIL 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

April 1952 brought a rather abrupt change to spring in most of Idaho, after six months of subnormal temperatures. A few of the higher elevation stations in south central and eastern portions of the State still reported average monthly temperatures below the April mean, but all division averages were above the 55-year mean. Precipitation was below the April mean in all divisions, with the north averaging just over 50% of the mean and the southwest and southeast just under 60%. Deficiencies were particularly marked in Shoshone County, in the Clearwater Basin and in the Payette and Weiser River Basins. Average snowfall for the State was well below the 55-year mean with little or no addition to the record, or near-record, accumulations at the end of March.

Light precipitation occurred throughout the State on the 2nd and 3rd of April with subnormal temperatures on the 1st gradually rising to near normal by the 3rd. Warm, sunny weather from the 4th through the 6th was followed by cooler weather and widespread, though light, showers as a weak cold front, moving eastward, ushered in a mass of cool air from off the northeast Pacific. Fair weather accompanied by gradually rising temperatures prevailed from the 8th to the evening of the 13th. Showers moving eastward across the State during the following 36 hours were again accompanied by a change to cooler weather. Several stations reported snow during this period, with falls up to eight inches at some southeastern localities. The return to sunny weather was rapid and temperatures rose quickly, reaching levels 10° to 15° above normal on the 18th. The next brief period of showers, on the 19th and 20th, brought as much as 1/4-inch of rain to Northern Division stations, but left only scattered light amounts in the south. Temperatures dropped throughout the State, however, and recovered slowly despite sunny skies during the next few days. The week from April 21 to 27 was perhaps the most important of the month from standpoint of weather and its effects upon the economy of Idaho. Very little rain fell during the week, but temperatures rose to levels nearly 10° above normal by the 23rd, and averaged more than 10° above normal through the 27th. Rapid melting of snow at intermediate levels resulted, streams became swollen, and several rivers went over their banks. Cooler weather during the last three days accompanied a final spell of cloudy skies and light showers, but by that time the snow cover had disappeared at all but a few higher-elevation reporting stations.

Under the influence of the rather sudden change to mild weather early in April spring field work on Idaho farms and ranches progressed rapidly, and where earlier planting had been possible, crop growth was exceptional. Pastures and lower ranges improved rapidly and early fruit trees blossomed suddenly. There was, however, a delay in the arrival of spring over most of the south central and eastern portions of the State. There the generally higher elevations with their lower temperatures and longer persistence of snow cover, delayed field work until after mid-month. The unusually warm weather of the fourth week permitted field work to progress rapidly in all agricultural areas except those at the highest elevations. Freezing temperatures in the early morning were reported at many stations in the State on the final days of the month, but little damage resulted. In northern counties winter wheat appeared to be in excellent condition, but with disappearance of the snow cover on south central and southeastern fields, some loss was noted with indications that some replanting would be necessary.

No damaging storms were reported in Idaho during April.

FLOODS

As indicated in the Weather Summary, a spell of unusually high temperatures, persisting through the fourth week, brought rapid rises in streamflow over much of the State. Earlier warm spells near mid-month and the more prolonged later spell resulted in flooding on a number of streams.

The Snake River from the vicinity of Weiser southward to the mouth of the Owyhee, was over its banks from April 16th through the 21st and again from the 27th through the end of the month. Fed by extremely heavy runoff from the Owyhee and heavy discharges from the Boise, Payette and Weiser Rivers, the Snake at Weiser reached its highest stage since 1910. Damage in Idaho was comparatively light, being largely confined to some highway damage near the mouth of the Payette and damage to installations in the amusement park on Mortimer Island at Weiser. The Weiser River, which had experienced one flood crest on March 31st, was out of its banks again for several days at points near the mouth and also above Cambridge, Idaho. On the gage near Cambridge a stage of 7.68 ft. was recorded on April 27th. The highest on record there since 1939 was 8.30 ft. on March 31, 1940.

The Big Wood River, rapidly filling Magic Reservoir, overflowed the dam and the river banks below the reservoir in the early morning of April 23rd. By the 24th the water stage recorder below the dam was submerged, but subsequent determinations, based on high water marks, fixed the peak stage at 15.68 ft. on the 28th. That surpassed by more than 2 ft. the previous recorded high of 13.31 ft. on April 13, 1943.

The Little Wood River went over its banks near Carey on April 22nd, threatening to flood the village of Carey. Prompt action in building and reinforcing dikes prevented serious flooding in Carey, and diversion of much of the stream onto lava beds south of town averted serious flooding downstream at Richfield and Shoshone. Nevertheless, despite all efforts, considerable damage did result from high water on the two Wood Rivers. Canals, diversions, bridges, flumes and roads were damaged and some 2000 acres of farm land inundated. Preliminary estimates indicate damage to the extent of nearly a quarter-million dollars.

The Portneuf River, rising rather slowly, began spilling over its banks as early as the 15th at some points near Pocatello. The result was partial inundation of a golf course and of some farm lands, with at least one residence isolated by the flood waters. Overflow began at a stage of about 3.8 ft. on the Weather Bureau gage at Pocatello and by the close of the month the river at that point reached a stage of 4.5 ft. and was still rising.

STATIONS NOT FOLLOWED BY A TABLE NUMBER REFERENCE IN THE STATION INDEX ARE NOT PUBLISHED IN CLIMATOLOGICAL DATA BEGINNING WITH OCTOBER, 1951, RECORDS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables, 3,5,6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Statio Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on grou values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of n snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station ha been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, Ju and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summar Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regardi subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1952

IDAHO - MAY 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With statewide average temperature 1.1° above that of May 1951, and 1.3° above the long-period mean for May, this was a month of generally pleasant weather in Idaho. The average number of rainy days was about normal for the month, with average precipitation for the State as a whole about ninety percent of the May mean. Considered by divisions, however, total precipitation presents a different picture. In the Northern Division large deficiencies in the far north were more than offset by large excesses in and near the Clearwater Basin, resulting in a division average a little above the mean. The Southwestern and Southeastern Divisions both showed averages somewhat below the mean, yet in both divisions there were stations, mostly at higher elevations, with substantial excesses. In the area drained bv the Snake River and its tributaries, from the mouth of the Boise River upstream, most stations showed precipitation deficiencies. This was particularly noticeable in the areas drained by the Lost River, Henry's Fork, and the Snake from the vicinity of American Falls upstream to its junction with Henry's Fork. Indications are that sunshine was a little below normal in southern Idaho, but above normal in the northernmost part of the State where precipitation was relatively light. Relatively strong winds, typical of the season, were reported on a number of days during the month, particularly in southern Idaho. Damage from winds was almost wholly confined to two days - the 3rd and 14th - but on other days local dust storms occurred in south-central and eastern portions of the State.

As the month opened a cold front was moving southeastward across Idaho, accompanied by general shower activity in the Northern Division and in most of the Southwestern. The Southeastern Division, however, experienced only widely scattered light showers as the front became nearly stationary, leaving about one-third of the State still in the warmer air mass. Light showers continued through the 4th in all parts of the State, and for several days more in the Northern Division. From the 7th through the 9th precipitation was again general in Idaho, with many northern and southwestern stations reporting falls of one-half inch or more, and several stations over one inch, on the 8th. Daytime temperatures on the 8th were lower by several degrees than on the preceding day and a few points in the State reported light snowfall. Mild weather with partly cloudy skies prevailed from the 10th to the 13th, when showers broke out over all of northern Idaho. By the 14th cooler air had invaded all but the southeastern portion of the State and by the 15th all of the State had been affected. Precipitation in the cooler air was general in the north and southwest where several stations reported thunderstorms and a few reported light hail. The final 15 days of May brought predominantly mild weather to Idaho with only occasional light showers in most areas. Nevertheless, it was during this period that southeastern Idaho received its heaviest precipitation of the month. Between the 20th and 22nd a majority of the stations of that division reported the greatest 24-hour amounts, although these amounts were less than one-half inch at most stations.

A general summary of the effects of weather on the agricultural economy of Idaho during May 1952 would indicate favorable conditions. Some exceptions were the tendency to rapid decrease in soil moisture on the dry farms of the Southeastern Division, the retardation of field work and planting because of excessive rains in Nez Perce, Lewis and Idaho Counties, and scattered frost damage. The frost damage, however, was not excessive and as usual for the month of May was principally confined to loss of garden vegetables. Fruits progressed very well with little or no frost damage, row crops in irrigated areas grew rapidly, small grains generally made good growth, ranges and pastures in most areas were in good condition and much potato planting was accomplished. Livestock were reported to be in good condition with some movement to summer ranges toward the end of the month.

Storm damage was caused almost wholly by wind with reported damage confined to the 3rd and the 14th. On the earlier date high winds were reported at such scattered points as Atlanta, May, Shoshone, Springfield, Pocatello and McCammon. Near Atlanta power poles were blown down, hundreds of trees were toppled and some 30 miles of Forest Service telephone lines damaged. Near May a cinder block building and two frame buildings were wrecked and three derricks upset and damaged. On the 14th high winds were reported generally in the south-central and southeastern portions of the State, with some damage to outbuildings and trees. Several localities reported dust storms as winds reached 48 miles per hour at Twin Falls, 50 miles per hour at Preston and gusts ranged upward to 65 miles per hour at Springfield.

FLOODS

Compared with the extensive flooding in southern Idaho during April 1952, this month brought only minor floods. At Pocatello the Portneuf River continued above flood stage until the 18th, with a crest at midnight of the 7th. Camas Creek near Camas in Jefferson County was high early in the month with a peak discharge of approximately 1000 c.f.s. some time between May 1st and May 9th. This is one of the heaviest flows ever experienced on that stream. Although not above bankful stage, the Snake at Heise reached a peak stage of 8.22 ft. on the 5th and Henry's Fork at Rexburg 9.49 ft. on the 6th. Preliminary estimates of flood damage for the 1952 spring season place the losses in southern Idaho at approximately one million dollars with agricultural losses constituting in the neighborhood of 90 percent of that total.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JUNE 1952
Volume LV No. 6

SAN FRANCISCO: 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Statewide average precipitation of 2.04 inches places this June among the upper 20% for the 60 years of record in Idaho. The Northern Division average was 186% of normal, a figure exceeded only once since 1893. Average precipitation in all divisions was more than double that of June 1951, and the average number of days with measurable precipitation was nearly twice as great. Temperatures, despite the prevalence of cloudy skies and the frequency of precipitation, averaged just about normal for the State. The Northern Division, however, was cooler than normal, while the Southeastern Division, where most of the precipitation fell late in the month, averaged a little above normal. Sunshine was generally deficient with percent of possible at Boise 13% below normal and lower than in any June since 1945.

Throughout the State the first nine days were warmer than normal and precipitation was generally light. Work on farms progressed rapidly during this period; spring seeding was completed where earlier rains had caused delay, potato planting was nearly completed, sugar beet thinning went forward rapidly and haying was started in some areas. Sharp drops in temperature on the 10th followed a cold front that moved rapidly eastward across the State during the night of the 9th. The cold front ushered in a 3-day rainy spell in the Northern and Southwestern Divisions, but in the east rainfall was not sufficient to be of much benefit to dry-land crops. Some snow was reported in northern Idaho during this period and on the mornings of the 12th and 13th freezing temperatures were reported at stations in all sections of the State. Considerable damage to gardens resulted, but damage to field crops was not extensive. During the next week generally fair weather prevailed in southern divisions, but the north continued to have frequent showers throughout the balance of the month. Temperatures gradually rose to above-normal levels by the 17th in southern sections, but by the 21st another major cold front had swept across the State; and from that date until the end of the month daily temperatures were, with few exceptions, below normal. Showers were frequent during the last ten days and substantial rainfall was reported in all parts of the State. The showers were very beneficial to most dry farms in eastern Idaho; where drought, or near drought, conditions had persisted for three or four weeks. In some agricultural areas of the Northern Division, however, the rains further retarded field work. Some hay that had been cut was damaged by the rains, particularly in south central districts. There was also some loss of sweet cherries and green pea harvesting was delayed, but in most sections pastures and ranges continued green and livestock were in good condition at the close of the month.

Weather elements took a toll of one human life and caused some property damage during the month. On June 5th, in the afternoon, a boy and his horse were killed by lightning about eight miles east of Jerome. On the 18th, between 5:30 and 6 p.m., hail and high wind did an undetermined amount of damage to row crops in the vicinity of Parma. Finally, on the 26th at about 6 p.m., a thunderstorm, accompanied by heavy rain, occurred along the Snake River south of Cottonwood. During the storm,which covered a path some two miles wide and several miles long, eight head of beef cattle valued at $2500 were killed by lightning; and debris from the sides of the canyon was washed onto the road.

DJS

STORAGE GAGE DATA WILL BE PUBLISHED HEREAFTER IN THE JULY OR AUGUST ISSUES OR AS DELAYED DATA IN THE DECEMBER ISSUE.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST and 5:30 p.m., MST.

-	No record in Tables 3,6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July and August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

JANUARY 1951	Conda, temperature departure should be 3.1°.
	Ririe, total degree days should be 1355.
FEBRUARY 1951	Kellogg, precipitation departure should be 1.54.
APRIL 1951	Island Park Dam, precipitation departure should be -1.30.
MAY 1951	Montpelier RS, precipitation departure should be -.48.
	Porthill, total degree days should be 310.
	Spencer, precipitation departure should be -.42.
SEPTEMBER 1951	Coeur D'Alene RS, precipitation departure should be -.67.
	Ola 4 S, delete precipitation departure.
DECEMBER 1951	Pierce RS, Delayed Data for October 1951, temperature departure should be -6.7°.
JANUARY 1952	Ola 4 S, precipitation on 13th should be .04, monthly total, 2.41, and days with .01 or more, 15.
	Lewiston WB AP, temperature departure should be -1.9° and precipitation departure, -.59.
MAY 1952	Tetonia Experiment Station, record prior to May 18, 1952 should have been known as Tetonia.

IDAHO

JULY 1952
Volume LV No. 7

SAN FRANCISCO: 1952

IDAHO - JULY 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Averaging more than 2° cooler than July 1951, and 1.7° below normal, this month brought less than 50% of normal rainfall to the Northern Division and slightly more than normal precipitation to the Southwestern and Southeastern Divisions. Hours of sunshine were near the mean for July and thunderstorms occurred with about the usual frequency over most of the State. Destructive winds were few and of limited extent, as were hailstorms and damaging rains.

Following the cool, rainy weather of late June, the first week in July brought a shift to drier, warmer weather over much of Idaho. Crop growth was accelerated and good drying weather permitted resumption of haying in many areas. The second week brought a furthur rise in temperatures with dry weather over much of the State. Substantial amounts of rain did fall on the 11th and 12th in the Southeastern Division, however, greatly benefiting dry-land crops. Rapid crop growth continued during this week with grains heading out in irrigated areas and ripening in dry-land areas. In the lower valleys near Lewiston some wheat was harvested. Temperatures dropped during the third week, but crop growth continued favorable and much haying was accomplished as showers were light and spotty. Wheat harvesting increased and apricot picking was started. Light, spotty rainfall and near normal temperatures characterized the fourth week as winter wheat began to mature, second-crop haying was started and potatoes reached the stage of full bloom. On the last day of the month heavy showers were reported at several points in southeastern Idaho. Near McCammon crop damage approximated $10,000 as the result of high wind, rain and hail.

The fire hazard in southern Idaho was low on all forests and ranges at the beginning of the month, increasing gradually as temperatures rose and rains became spotty. During much of the month there was little danger of fire in the higher forests. Even on lower-elevation forests and ranges the hazard was never extreme and fires that did start were quickly brought under control.
